

Does medical marijuana improve physical function in people with Multiple Sclerosis?

Researchers from the Colorado State University Integrative Neurophysiology Lab are currently recruiting both people with MS who are and those who are not using medical marijuana to participate in a study investigating how medical marijuana effects motor performance.

Eligible participants will come to CSU for 3 visits separated by about 1 week. During the visits participants will perform several functional tests like walking for 6 minutes and muscular strength testing.

If interested please go online and complete a short eligibility survey at the address below. After you have completed this one of our staff members will contact you and discuss your eligibility.
